```
this sequence represents the polyprotein of the BeV proteivpe isolate BFVI. When compared with all known viral sequences, small but stantient terilinear behalouses are cheered with the non-structural proteins of the Hamburius family, and with the pestivitieses. The demains shown in the features table are however, rentained by assignand. The polyprotein, and epitopes of it are bestoric in discount induction intrologies, in a subject analyst BFV. The presence of Abs against BFV can be detected using an

The sequence is derived from a composite HCV cDNA from HCVI, a prototypic HCV. The DNA sequence is based upon sequence information derived from a no. of HCV cDNA clones, which were isolated form a no. of HCV cDNA clones, including the "c" library present in lambda qt11 (ATCC No.40394), and from human serum. The HCV cDNA clones isolated by methods described in We9014436.

The clones from which the sequence was derived arc 5'clone32, b114a, 18q, aq30a, CA20a, CA20a, CA216a, pil4a, CA167b, CA156e, CA84b, 33c, 40b, 37b, 35, 36, 81, 25, 13i, 12f, 14i, 11b, 7t, 7e, 8h, 33c, 40b, 37b, 35, 36, 81, 23, 37b, 25c, 14c, 81, 33f, 33q, 39c, 35f, 19q, 26g, 16a, 6k and p131jh.
                                                                                                                                                                                                                                                                                                                                    Gaps
acid indicated in the features, the parentheses indicated that the heterogeneity was detected at or near to the 5^{\circ} or 3^{\circ} end of the HCV in the clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatitis; liver disease; HCVI; monoclonal antibody; epitope; immobilised reagent; immunoassay; diagnosis; detection; treatment; infection.

The insertion procedus two mew isolates of deparities C virus (BPV), JI and JP. inser two isolates compeles indicated and confidences when that are fishing the uncertainty the much of described and sequences may be used to detect near, non-H BPV (NAMEH) polymorleotides by hydriths attention for distincts of NAMEH intections. They may also be used to serve these distincts or named to be one of the isolates and the polymorleotides for this intection. The isolates are naturally occurring within as a the polypeptides may be used as a zaccine for the initial static to periods to protect against injection with many in the processure sequence represents the amino acid sequence of HCV-1 oRF.

comprises a hepatitis C View (HCV) artisense polynocleotide. The HCV is characterized by a positive stranded knA genome which has 40% beneforg at the polypeptide level to a HCV polyphotein. The antisense polynocleotide binds to cellular polynocleotides which exhance and/or are required for viral interviently, replicative which eshance and/or are required to viral interviently, replicative ability, to be otherwicity. The antisense polynocleotides may also be designed to bind with high specificity, to be of interased stability, to be stable and to have low toxicity, to be of interased stability. The anatomic masses with line and to have low toxicity. The composition also compute section is used for preventing HCV replication in a system. The posent sequence is encoded by a novel HCV cDNA sequence, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel composition comprising a hepatitis C virus antisenso polyno bodide which is complementary to or corresponds to a sense strand of the virus genome, and selectively hybridises to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a pharmareutical composition which

Bits separate represents the entire hepatitis of virus polyprotein. BY is a member of the transmiss tamily not appears to encode a basic polyproteic demant ("\") if the N-terminal of the Wiral polyprotein, followed by two alyesprotein domains ("Hi", "EZ/NSI"), upstream of the necessivity all penes NSZ through NSS. RMA viroaces frequently calible a high rate of spontaneous mortation, thus a virus is considered to be the same of equiv. To HCV if it exhibits a abbal homology of more than 70 percent with the HCV HT if a sequence indicated in the teatures table can immunicate ally minde proteins encoded by HCV. Additional amino acids or chemical aps. may be added to either end of the poptides for the purpose of the acids of the peptides for the purpose of the fact and the acids of the peptides where the world is a like an incidence of the poptides of the peptides for the used for the detection of a fibodies specific for HCV. ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be of increased stability, to be of increased stability, and to have low texicity the composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymerase chain reaction PCF, amplify, primer, bepatitis C virus; HCV, asymptomatic, chronically infected; epitope; viral isolate; domain; immunological, cross-reactive; envelope protein; "accine; ap53(BVDV)/9p55, hog cholera virus, postivirus, NSL, flavivirus.
                                                                                                                                                                                                                                                                                                                                                                    Novel composition comprising a hepatitis C virus antisense polynucleotide which is complementary to or corresponds to a sense strand of the virus genome, and selectively hybridises to it -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a pharmaceutical composition which comprises a hepatitis C virus (ACV) antisense polymorfectide. The HCV is characterized by a positive stranded RNA qenome which has 40% homology at the polypeptide level to a BCV polyprotein. The antisense polymorfectide binds to cellular polymorfectides which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.5%, Score 59; DW 21; Longth 2772; 34.5%; Prod.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   edimpanzee with chronic HCV infection. A lambda gall library was chimpanzee with chronic HCV infection. A lambda gall library was screened with probes derived from previously isolated clones. The OPF is derived from the overlapping clones pida, cal67b, Cal56e, Ca84a, CA59a, F9-1, 121, 141, 11b, 71, 81, 34, 34, 46b, 37b, 75, 36, 81, 32, 34b, 25c, 14c, 81, 31, 33q, 39c, 35f, 19q, 26q and 15e. This polypeptide can be used to design probes. The detection of HCV nucleic acids, in screening programmes for the detection of HCV nucleic acids, in screening programmes polymucleotides can be used to inhibit viral replication.

the GST gene and the fusion protein expressed (see also AARBT31). The fusion protein was used in the isolation of a protein of mammalian origin which binds a glutathione-Stransferase (SST)-FK506 binding protein GST gene and corresponding but at the isolated from Molt4 cells using a complex of the tusion protein GST FKBP12 and rapamycin. The isolated protein molecular weights of 125, 148, 208 and 210 km. The isolated proteins have molecular weights of 125, 148, 208 and 210 km. They can be used for identifying an immunomodulatory, or an antitumour agent. They can also metabolites when complexed with FKBF. Antisense DRA ran be used for metabolites when complexed with FKBF. Antisense DRA ran be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein between jutathione's tranferase (GST) and SEP. The sep genewas amplified in five fragments using the primers given in AAT00756-69. The amplified SEP genewas inserted into a vector already containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the sirolimus effector protein (SEP). The CDNA encoding this sequence was isolated from Molt. 4 human T-cell legbarmia cells (AFFC CPL 1582) and used in the production of a fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New effector proteins of rapamyein - which bind to a glatathione S transferase PK506 binding protein-rapamyein complex

```
If is the sequence encoded in the open reading trame of hepatitis \dot{\rm C} virus (BCV) cDNA inserts in clones K9-1 through 15c. It is antiquarie and could be used in immanoassay readents and vacetnes and to detectate antiteduce useful in diagnosis and passive immunotherapy for BCV intection/rea A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of states

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22-MAR-1994 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Purified hopatitis o virus
```

```
It is the sequence encoded in the open reading frame of hepatitis C virus (HVV) coMva inserts in clones 12f through 15e. It is antigenic and could be used in immunodasay reaqents and vaccines and to qenerate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence encoded in the hepatitis C virus (HCV) cDNA inscits in clones 12f through 15e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is the peptide encoded by the composite hepatitis C virus (HCV) cONA of AAH90331. The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RMAS which possessed several erroneous main, avids The FNA viruses are used in vaccines against pollo. The screening method can be used during amplification of the source virus for vaccine prodn. to ensure maintenance of C at position 2493 in the viral genome i.e. increasing the attenuation. The new prod, overcomes the problem of errors introduced during replication of ss RNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The protein sequence was deduced from the cDNA sequence of P3 policylars obtains. In Avillar, Start Sequence of a fact time RNA virus, i.e. the cDNA directs the plods, of a viable RNA virus which is phenotypically similar to the source virus. The tull length cDNA is phenotypically similar to the source virus transcription of pLED3 cDNA using TS RNA polymerase produced RNAS which possessed secent effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New vacatime against infectious pollo virus comprises RMA virus for producing RNA virus CDMA and viable RMA virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.5%; Score 59; DB 13; Length 2206;

This acquence represents a tusion protein constructed from the begatifies evirus core domain (which is situated at the carboxy ferminus of the tusion protein) and a c200 construct (a fusion of the NS3 and NS3 domains). This protein used in the construction of nevel confined to a five of accordance of immunological activity than any simple HCV antiden. An example of immunological activity than any simple HCV antiden. An example of immunological activity than specification comprises a first antiden containing at least W antiden actids of the C domain of the HCV polyprotein and a second antiden comprising at least. B amino actids of the NS3 domain, the NS4 domain, the S4 domain of the RCV polyprotein in the form of a fusion protein a physical mixture of board to a soild matrix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               It is the sequence encoded in the open reading trame of hepatitis 'viris cbNA inserts in clones 141,m 11b, 71, 7e, 8h, 4c, 40t, 47b, 6, \alpha, \alpha, and 18h, 32, 34b, 35e, 14c, 8h, 4t, and 4e, it is antiqueric and could be used in immunoassay requests and vaccines and to generate antihodies useful in diagnosis and passive immunoatherapy for BCV intection/row.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant antigens representing distinct antigenic regions of Hepatitis C virus (BCV) geneme, useful for detection of antibodies and antigens in body fluids of individuals exposed to BCV ^{\circ}
                                                                                                                                                         A specific antidenic region of the HCV genome is expressed as a chimeric fusion with E coll CMP-KDO synthetase (CKS) gene. The fusion profein page 3 can be used to detect antibodies and antigen in body fluids from individuals exposed to HCV e.g. in confirmatory, competition or neutralisation assays. The same amine acid sequence (i.e. AAR33571) is described in the specification as pHCV-205.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HCV recombinant antiqen pHCV-205 amino acid sequence SEQ 1D NO:54.
                                                                             Hepatitis C assay using recombinant C-100 region antiqens - for detecting antibudies and antique in body fluids from infliduals exposed to hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                      0;

the present invention describes recombinant Repatitis C virus (RCV) antigens (I). (I) is useful as a reagent for the detection of antibodies and artigen in body fluids from individuals exposed to BCV. The BCV assay uses reliable and efficient reagents and methods to accurately detect the presence of BCV antibodies in samples obtained from the individuals auspected by the ABS1379 and AABS001 to AABS002 represent sequences used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "c200 (amino acids 1192-1931 of HCV polyprotein)"

antiques (1). (1) is useful as a readeft for the detection of antihodies and autique in body fluids from individuals exposed to BCV. The BCV assay uses reliable and efficient readefts and methods to accurately detect, the presence of BCV antibodies in samples obtained from individuals suspected of having BCV infection. AARAZZZB for AARSTR1 to AARSTR79 and AAR69001 to AABSD02 represent sequences used in the exemplification of the present invention.

The primers (AAG55718-23) are used to design probes (AAR45745-18) for
the alpha-thA pelygocase gove (AAG5724). The gene lised I was
amplified using primers (AAG5725-26). This method of closing
alpha DAA polymerase is easy and effective allowing quick and easy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes recombinant Hepatitis C virus (BCV) antiques (I). (I) is useful as a reagent for the detection of antibodies and antique in body floids from individuals expresed to BCV. The HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cut torrog RA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant antigens representing distinct antigenic regions of Hepatitis C virus (HCV) genome, useful for detection of antibodies and antigens in body fluids of individuals exposed to HCV .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       assay uses idiable and efficient reasonts and methods to accurately detect. The presence of HCV antibodies in samples obtained from individuals suspected of having HCV infection. AAB7221B to AAF3235, AAB51371 to AAB71379 and AAB69001 to AAB69032 represent sequences used
chimeric fusion with E.coli CMP-KDO synthetase (CKS) gene. The fusion protein pHCV 72 can be used to detect antibodies and antigen in body fluids from individuals exposed to HCV e.g. in confirmatory, competition or neutralisation assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HCV recombinant antigen pHCV 72 amino acid sequence SEQ ID No:52.

It is the sequence encoded in the open reading trame of departitis \tilde{v} virus (\theta v V_{\rm c}) can insert in clones 40b, 47b, 45, 46, 81, 42, 44 and 2°c. It is an epitope which could be used a minimons asy reserved and vaccines and to generate antibodies usered in diagnosis and passive immenoifiering to the HeV intection/mon-A, non-H by attitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence encoded in the hepatitis C virus (BPV) cDNA inserts in chares 40b, 37b, 35, 36, 81, 32, 34b and 25c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Clone; DNA polymerase; hybridise; amplification; denetic endinection; PCK; polymerase chain reaction; restriction map; plesmid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  licker DNA sequences, 266 amine acids of the HCV NS3 region. 2 amine acids contributed by linker DNA sequences, 256 amine acids of the HCV NS4 region and 10 additional amine acids contributed by linker
                                                                                                                                                                                                                                     the nepalitis core virus protein (HCV) coding sequence was used in the construction of an expression vector designated pHCV-31. This vector allows the fusion of recombinant proteins to a CKS vector allows the fusion of recombinant proteins to a CKS or CTP-2MH-3 west, Femanoco 4.1 sounds of the CKS protein coding sequence in the construct lacilitates the detection and purification of heterologous proteins and gives tusion proteins which are expressed at high Densis. The HCV PYS-3-APM antiqual provinces of the amino acids of FKS, within amino acids contributed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps
Prodn. of recombinant hepatitis virus core protein - as fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HCV recombinant antigen pHCV-31 protein sequence SFQ ID NO:4.

The BRV CKE-ros-Edg expression sector pBRV 31 was constructed from a clone expressing the 4FC KES-BRD and shall designated pBFV-24) and a clone expressing the 4FC KES-BRD antique (designated pBFV-24) and BFCV EGG expression to produce produce pBFCV-29. The FFCV KES-44 and Inserted into pBFCV-29. The FFCV FRO Edge of the FFCV-29 and sometimes of EGG entrance coasists of ZG samino acids of TKS-43-BFCD adjusted edgesists of ZG septembers, ZG and no acids of the FFCV NS+4 region (amino acids of TKS-43-BFC) and and sequences, ZG and the FFCV NS+4 region (amino acids of the FFCV NS+4 region (amino acids of the FFCV NS+4 region (amino acids of the FFCV NS+4 region) and load additional amino acids contributed by linker INA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatitis C assay using recombinant C to region autidous for detecting antibodies and antique in body finids from individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C Virus; non-A, non-B hepatitis virus: NANBH;

CKS methods of protein synthesis are known in the art, for inst. a cks method has been disclosed in EP A 0331 961. Six individual nucleotides representing AAS 11-150 of the HCV genome were liquated together and cloned as a 456 base pair ForeI-PamHI fragment into the FKS fusion vertex pinced in From FereI-PamHI fragment into the FKS fusion vertex pinced in From FereI-PamHI fragment into the FKS fusion vertex pinced in From FereI-PamHI fragment from sequences, and the first 150 AAS of ECV. To construct the plasmid pHCV-31, the 781 base pair EcoRI-BamHI fragment from pECV-23 representation the FFC BCD recombinant antiqen fragment from pECV-23 representation from FECV-31, axpresses HCV ECS Tecombinant antiqen which consists of 239 AAS of CKS, 33-BCD recombinant antiqen which consists of 239 AAS of CKS, 8 AAS contributed by linker DNA sequences, 256 AAS of the HCV NS3 region (AAS 1957), 2 AAS (AAS 1956-1931), and 10 additional AAS centributed by linker DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

```

```
The present invention describes recombinant Hepatitis C virus (HCV) and beautions (1). (1) is set if as a realent for the detection of antibodies as district the finite and efficient expects to HCV. The HCV reserves relimite and efficient realents and methods to accurately intributed as suspected of azite HCV interior. ANY 22218 to ANY 2228, AARCOUNT ANY COURT OF ARROWS TO ANY 2228 and the exception of the presence of the presence of the ANY 2228 and ANY 2228.

Levels of the HCV CKS-collo recombinant antique. HCV CKS-cillo antigen consists of 23% arina antis of CKS, eight amino acids court. Bolted by linker 23% sequences, 30% amino arias from grow camino acids 164-1941) and 10 additional amino acids region (amino acids 164-1941) and 10 additional amino acids contributed by linker DNA sequences. A 63th NlaTV-HaelII fragment was deleted from pHCV-24 (a plasmid which expresses the HCV CKS-collo antigen under control of the lac promoter). The pHCV-58 fusion protein (containing a 21 amino acid deletion, i.e. of HCV amino acids limit HEZDI was expressed at a significantly higher level than the pHCV-24 fusion protein.
                                                                                                                                                                                                                                                                Hepatitis C assay using recombinant NSI region antigens – for detecting antibodies and antigen in body fluids from individuals {\sf detecting}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HCV recombinant antigen pHCV-58 protein sequence SEQ ID NO:18.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      contributed by linker DNA sequences. A 53bp NialV-Hacill fragment was deleted from pHCV-24 (a plasmid which expresses the HCV CKS-follo antiqen under control of the lac promoter). The pHCV-58 rision protein (containing a 21 amino acid deletion, i.e. of HCV amino acids 1609 1620) was expressed at a significantly higher level than the pHCV-24 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        levels of the HCV CKS cl00 recombinant antigen. HCV CKS-cl00 antigen consists of 239 amino acids of CKS, eight amino acids contributed by linker DNA sequences, 363 amino acids from HCV NS4 reqion (amino acids 1569-1931) and 10 additional amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 detecting antibodies and antigen in body fluids from individuals

A 646 p Native Back to the West was deleted by linker bNA sequences. A 646 p Native Back to the Colon antique under control of the lac promoter). The pHPV 68 closs antique under control of the lac promoter). The pHPV 68 amino acids 600-1620 was expressed at a significantly biomer level than the pHCV-24 Instead of the deletion, i.e. of HCV families acids 1600-1620 was expressed at a significantly biomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tor hepatitis of assay for

A 69bp Ddc1 fragment was deleted from pHCV-24 (a plasmid which expresses the HCV CKS cl00
                                                                                                                           The clone pHCV-57 was constructed to overcome poor expression levels of the HCV CKS-cl00 recombinant antiqen. HCV CKS-cl00 antiqen consists of 299 amino acids of CKS, eight amino acids contributed by linker DNA acquences, 363 amino acids from HCV NS4 region (amino acids 169-1931) and 10 additional amino acids contributed by linker DNA sequences. A 69bp Ddel fragment was
                                                                                                                                                                                                                                                                                                                      defected from $\text{phys.24}$ (a piasmid which expresses the HCV CKS-cl00 antiqen under control of the lac promoter). The pHCV-57 fusion protein (containing a 23 amino acid deletion, i.c. of HCV amino acids 1575-1597) was expressed at a significantly higher level than the pHCV-24 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C assay using recombinant MSi region antigens—for detecting antibodies and antigen in body lluids from individuals exposed to hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mepatitis C Virus, non A, non'B hepatitis virus, NANBH,

(1) is useful as a reagent for the detection of antibodies as a reagent for the detection of antibodies assay uses reliable and efficient reagents and methods to accurately detect the presence of HCV antibodies in samples obtained from individuals suspented of having HCV intextion. AAPS2228 to AAPS2235, AAASS377 to AABS1379 and AARS4001 for AARS4032 represent sequences used in the example intextion of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dawson GJ, Gutlerrez RA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus (HCV) genome, useful for detection of antibodies and antiques in body fluids of individuals exposed to HCV ^{-}
